This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, piscirickettsia salmonis. The method comprises administering an immunogenic amount of a salmonis specific antigen termed OspA, or an immunogenic fragment of p. salmonis specific antigen. The method is used for protecting animals, oppA in the form of a vaccine. The method is used for protecting animals, pathogen particularly poikilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettail diseases. The present sequence represents the amino acid sequence of C17E2, a p. salmonis OspA sequence represents the amino acid sequence of C17E2, a p. salmonis OspA undefined N-terminal fusion partner. The fusion protein is used in a undefined to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (BURI/) BURIAN J.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a method for the protection against infection of a polklichtermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a salmonis specific antigen termed OspA, or an immunogenic fragment of P. salmonis specific antigen termed OspA, or an immunogenic fragment of particularly poikliothermic fish, against the bacterial pathogen particularly poikliothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid P. salmonis ospA protecting against salmonid sequence represents optimised P. salmonis OspA protein 17E2. The DNA sequence represents optimised P. salmonis OspA protein 17E2. The DNA sequence represents optimised P. salmonis OspA protein 17E2. The DNA sequence represents optimised P. salmonis OspA protein 18E2 (AAF86247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is Ecsherichia coli. An OspA protein with an N-terminal fusion partner is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17-SEP-1999;

The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents P. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antipody resents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polysaccharide binding domain (pab) fusion protein. The method is used to alter the structural, chemical, physical, electrical and used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide meterials such as paper, yarns, fibers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD properties such as wet strengths, durability and elasticity. The PBD properties such as its forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker which eliminates the sizing step. The use of a biological crosslinker the fine fibers in a slurry therefore resulting in better recovery of the fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 02-NOV-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 1.2; Fig 1e-1g; 121pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.
The method involves treating the polysaccharide structure with a

The present invention relates to methods and compositions for cross-cc linking and/or modifying the properties of polysaccharide materials. CC The method involves treating the polysaccharide structure with a CC polysaccharide binding domain (PBD) fusion protein. The method is CC queed to alter the structural, chemical physical, electrical and CC mechanical properties of polysaccharide materials such as paper, CC yarns, fibers and textiles, using biological crosslinking agents. CC yarns, fibers and textiles, using biological crosslinking agents. CC properties such as wet strengths, durability and elasticity. The PBD creagent is applied in the forming stage in fluting paper manufacture cc reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker cc improves the recyclability of paper products. The pBD reagent maintains can fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of can materials. The pBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAE05747;
The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.
                                                                  Example 1.2;

The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper, yarns, fibers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the fine fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is Clostridium cellulovorans cellulose binding domain (CBD) cross linker protein (CCP).

Note: This sequence is stated to be the same as that shown as SEQ ID NO: 6 in the sequence listing of the specification. However this sequence has an additional residue at its C-terminal.
                                                                                                                                                                                                                                                                                                                                                                     Cellulose binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

It pref. binds crystalline with a Kd ranging from 1.5 microM. 0.5 microM. C pref. with a Kd of <1.2 microM, esp. <1.0 microM. The protein and C the encoding DNA are claimed, as is a CBD fusion protein (FP) and a second protein. The second protein is pref. C comprising the CBD and a second protein. The second protein is pref. C reversing the cBD and a second protein of this. The cBD and FP C HSP-related protein or an antigenic portion of this. The CBD and FP C may be used in drug delivery, affinity sepns. and diagnostic may be used in drug delivery, affinity sepns. and diagnostic techniques. CBD nucleic acid may be obtd. from a variety of cell c sources that produce CBDs that bind with high affinity and in a creversible manner or that produce CBD encoding mRNA. The preferred C source of CBD encoding nucleic acid is C. cellulovorans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polysaccharide binding domain (pBD) fusion protein. The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide meterials such as paper, yarns, fibers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD properties such as wet strengths, durability and elasticity. The PBD properties such as wet strengths, durability and elasticity. The PBD properties such as the forming stage in fluting paper manufacture reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains improves the recyclability of paper products. The PBD reagent maintains raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Levy I,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to methods and compositions for cross linking and/or modifying the properties of polysaccharide materials. The method involves treating the polysaccharide structure with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preparation of a polysaccharide containing material having at least desired structural, chemical, physical, electrical and/or mechanical

The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the filers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                  binding domain (ProtA-CBD). This sequence contains a part of CBP A protein and a part of protein A derived from pRTT2T vector sequence Note: This sequence is stated to be the same as that shown as SEQ ID NO: 8 in the sequence listing of the specification. However this sequence has 2 additional residues at its C-terminal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.
The method involves treating the polysaccharide structure with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Preparation of a polysaccharide containing material having at least one desired structural, chemical, physical, electrical and/or mechanical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Levy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   08-NOV-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 118
                                                                                This sequence represents a cellulose binding domain (CBD) derived from the CbpA protein of Clostridium cellulovorans. The sequence is used the construction of a fusion protein which can be used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD, has very high affinity for cellulose (including to it. The CBD) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M) but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M) but crystalline forms are cellulolytic or amorphogenic activities. The CBD binds over has almost no cellulolytic or amorphogenic activities by washing with water.
                                                                                                                                                                                                                                                                                Detection of a specific analyte by reaction with binding agent fused to cellulose binding domain - and subsequent treatment with cellulose and reaction of insoluble product with a label specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW90081;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Clostridium
                                                                 This sequence represents a fusion protein (CBD-KpnI) composed of the Cb protein cellulose binding domain (CBD) from Clostridium cellulovorans This protein is used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD has very high affinity for cellulose (including crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but has almost no cellulolytic or amorphogenic activities. The CBD binds over a wide pH range and is not released from cellulose by washing with water.
                                                                                                                                                                                                                                                                                                                                                                                                                                           05-JAN-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                               Matches
                                                                                                                                                                                                This sequence represents a fusion protein composed of the CbpA protein cellulose binding domain (CBD) from Clostridium cellulovorans and a heat shock protein (HSP) fragment. This protein is used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD has very high affinity for cellulose (including crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but has almost no cellulolytic or amorphogenic activities. The CBD binds over

                                                                                                                                                                                        A modified cellulose binding domain (CBD) or fraction of it, linked to a hapten moiety via one or more Cys or Lys residues and complexes comprising the biotinylated CBD and a biotin-binding molecule selected from modified or unmodified avidin or streptavidin or an anti-biotin antibody, can be used in affinity chromatography, cell separation, cell, protein and enzyme immobilisation, selective removal of biological materials, multienzyme reactors, signal immunoassays and drug (e.g. pesticide) delivery. The CBD molecule can be modified with the hapten without affecting its high affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cellulose binding domain, CBD; hapten; molety; biotin; avidin; streptavidin; affinity chromatography; cell separation; cell immobilisation; protein immobilisation; enzyme immobilisation; multienzyme reactors; signal immunoassays; drug delivery; pesticide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
